

T03W04 / Institutional Innovation For Climate Governance

Topic : T03 / Wicked Problems

Chair : Gilles Massardier (Cirad)

Second Chair : Osmany Porto de Oliveira (Universidade Federal de São Paulo)

Third Chair : Karol Cortes (CIRAD)

CALL FOR PAPERS

Based on the four objectives outlined in the section on the workshop's questions and main objectives, some of the papers will be produced by the APIICC international project research team (on case studies and countries in Africa, Latin America, the US, and Europe), and of course another large part will be produced by researchers outside the APIICC project. Regardless of their origin, the articles must fall within the scope of work on climate governance and, in particular, the role played by procedural instruments, regardless of the public policy sector. They may be based on any type of research method, as the objective is to discuss the results of the APIICC project with those concerning other climate policy sectors.

They should either describe in detail procedural instruments invented with the aim of improving climate governance, or the process of their policy making, or their implementation, or the types of institutional innovation, or the profiles or strategies of innovators. Papers may, of course, cover several of these topics. Particular attention will be given to articles focusing on the debate between polycentric governance and authority. Papers may concern all types of instruments: those supporting climate finance governance or those supporting the governance of substantive technical instruments. The APIICC project addresses each of these points.

Finally, papers submitted next June should be as complete as possible so that they can be published fairly quickly after the IPPA workshop.

ABSTRACT

This workshop aims to discuss existing work on institutional innovation in climate policy governance. Its objective is to understand: what are these innovations, what innovative governance instruments are involved? Who are the innovators? What are the controversies surrounding possible innovations? What are their policy making and implementation processes? What are the theoretical interpretations of these issues? The team behind an ongoing international research project will present its findings for discussion with researchers focusing on the same issues. One of the objectives is to publish a book and/or special journal issues.
